

## INTRODUCTION

The unfolding energy transition, necessitated by international decarbonization agreements and other social and ecological demands, raises numerous questions about the roles cities, regions, communes, local cooperatives and other geographical-political-social entities will play. How will communities be positioned in shaping the future? Will the most important energy developments during the transition be at the level of sub-national regions and local communities? Or are transnational regional efforts equally well positioned to make a difference? How do social scale and corresponding forms of relations, association and organization align with particular ways of envisioning the future? The aim of this symposium is to examine the social dimensioning of the energy transition with a special but not exclusive consideration of the case of introducing hydrogen and fuel cells into the energy arena. The intersecting range of presentations will explore the relationship between the social scale of future visions and the social scale of actual unfolding of techno-social development. In the case of hydrogen, discussions will explore the question of how visions of the future involving this new energy vector are taking shape in distinct social and geographical spaces.
